

# Motorised Screens

## Why recommend a 2C Motorised Screen?

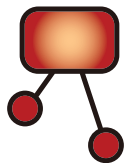

Roller Screens are the most popular style of screen available because they allow flexibility when they are installed.

When required they can be lowered into position. Then when the presentation is finished they are able to be easily stored out of the way, but always at the ready.

Roller Screens are available in either pull down or motorised versions. Often people buy pull down screens because they aren't aware of the value of installing a motorised screen.

Motorised Screens have many unique features and benefits for your customer, in addition to it just looking technologically advanced like everything else you are selling them.

### Features

### Benefits

Motorised screens have inbuilt limit switches so that the every time the screen is lowered it returns to exactly the same position

No chance of misalignment with the projector. Presentation looks more professional.

Motorised Screens retract steadily

No chance of the screen retracting too quickly and 'jumping off' the brackets, added OH & S safety feature.

Motorised Screens are factory set to stop just before the casing

This makes for a much longer life cycle than a pull down screen with less wear and tear on the screen surface.

Motorised Screens are operated via a remote control.

Ease of operation for everyone regardless of height and positioning of the screen.

Work using an IR remote

You can control use of the screen by managing access to the remote control.

Motorised Screens can be operated via a low volt trigger

If you prefer an integrated solution the screen can be triggered by a projector with a 12V out at no extra cost.

The features and benefits described here apply to 2C models – 2C504, 2C505, 2C506, 2C520, 2C525 and 2C521.
